Text							

- Everything that consists of readable characters that can be easily viewed by just displaying it in a terminal or printing with a typewriting device.
 - Just characters, no formatting.
 - No "binary" meaning, just plain old human-readable information.

What is text?

00000 000 00 00 00000	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	emboss o oo	
Text							

ASCII

Old, relyable, simple but restricted to 127 chars.

0:		(2	<	F	Р	Z	d	n	x
1:)	3	=	G	Q	Γ	е	0	у
2:		*	4	>	Η	R	\	f	р	z

Text								

Unicode and stuff

Unicode

A rather complicated encoding scheme using a variable number of bytes to encode text characters. Not restricted to a maximum amount of allowed chars. Can work with any language and alphabet.

UTF-8

Most popular Unicode-flavour. Nowadays, most terminals are set to UTF-8 encoding, so at least Umlauts and several other non-Ascii chars will "just work". Theoretically restricted to approx. 2 billion possible chars, practically much less complete but very usable.

Basics 000●0 000 00 00 00000 00000	00 000 00 00	Counting 00 0	CSV files 0000 0	Loops 0 0	emboss o oo	
Text						

Text Examples

- Most sequence data: .fasta, .gb, .sam...
- Comma (or whatever)-separated tables: .csv, .txt
- Program source code and scripts: .sh, .py, .pl, .c...
- Structured data and markup documents: .xml, .html...

	Datastreams 00 000 00 00	Counting 00 0	CSV files 0000 0	Loops 0 0	emboss o oo	
Text						

What is NOT text?

- MS-)Office documents: .docx, .xlsx, .pptx...
- Executable programs.
- Packed data: .zip, .gz, .rar, .bam, .bcf...
- Multimedia: Graphics, videos, sound...
- Several other application specific data, including some of the more integrated bioinformatics tools (CLC, Geneious)

Basics •••• ••• ••• ••• ••• ••• •••	00 000 00 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	emboss o oo	
Shell w	ork							

What's a shell anyway?

UI

A "user interface". Anything that allows a user to conveniently interact with an operating system.

Bash

The "Bourne again shell". Around since several decades, the most popular text-based shell, a derivative of the 1970s "Bourne shell". Allows efficient file and folder manipulation, text data manipulation and limited programming.

Basics 00000 00000 00000 000000	00 000 00 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	emboss o oo	
Shell w	ork							

How to connect to one?

Local

Open any terminal application. On Linux you'll probably see a Bash, on Windows you'll see DOS or Powershell (if you're lucky).

Remote

Use the SSH protocol to connect to a suitable server. Most popular SSH implementation on Windows is "putty".

Basics 00000 000 000000		Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops O O O	emboss o oo	
000								
Shell we	ork							

How to work with a shell?

Commands consist of a command "name", followed by options and arguments:

cp -r something somewhere

Helpers

Remember to use the history (up/down-keys) and text auto-completion (the Tab-key). Of course you can use your system's clipboard to copy/paste text snippets. Just in case your terminal seems stuck: Strg-c (Cancel) will unfreeze it in most cases. (Sometimes Strg-q is necessary.)

Basics 00000 00 00 00 00000 00000		Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	EMBOSS 0 00	
Quotati	on marks							

Quotes

Single quotes

Anything between singe quotes is handled "as is", a text string without interpretation.

Double quotes

A text string, that belongs together (spaces included) but will be interpreted. E.g. Variables will be replaced by their content. Characters with special meaning have to be "escaped".

Backticks

Anything in backticks will be interpreted as shell code and replaced by the result of that.

00		00000						
00 00000	00							
000								i i i i i i i i i i i i i i i i i i i
Quotati	on marks							

Reusing your code

Oneliners

You can type your commands – even complex ones – directly on the command line and execute them right away. If something goes wrong, use the cursor-up key and correct the errors.

Scripting

You can save your commands – especially complex ones – in a textfile and reuse them like small programs.

Basics	Datastreams	Filtering	Counting	CSV files	Editing	Loops	EMBOSS

00 •0 00000	00 00							
00000								
Variable	es							

Named boxes

Variables

Variables are like named boxes of data. You can store something with a name tag of your choice and use it later.

a=something echo \$a something

Basics 00000 000 00 00 00000 00000		Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	emboss o oo	
Variable	es						

Named boxes

In Bash, you can just assign something to a variable with the assignment operator "=". It will be created and filled if it doesn't exist, yet.

Basics 00000 00 00 00 00 00000 00000		Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	EMBOSS o oo	
Variable	es							

Named boxes

In Bash, you can just assign something to a variable with the assignment operator "=". It will be created and filled if it doesn't exist, yet.

If you put a Dollar sign in front of the variable's name, it will be "expanded" i. e. replaced by its content.

Basics		Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	emboss o oo	
Commo	n commands							

Caveats

- Bash is case sensitive!
 "raxml" is not the same as "RAxML".
- No questions asked!
 Bash assumes you know what you want. It will mercilessly overwrite any file you target a write operation on.
- Spaces are interpreted as delimiters! Be careful when using spaces: rm a* will delete everything beginning with an "a", while rm a * will delete "a" and anything! Use double quotes around variables that just *might* be expanded to something containing spaces, to avoid nasty surprises.

00000 000 00 00		Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0	EMBOSS o oo

00000 00 00 00 00000	00 000 00 00	00 0000 00			000			
-								

Common commands

File name "wildcards" et al.

When referring to file- and folder names, wildcards allow to address many files simultaneously. Be careful when using together with possibly deleterious commands like rm, cp...

- * any number of arbitrary characters (including none at all)
- [a-c1234] One of a given set of allowed characters,
 - e.g. a, b, c, 1, 2, 3, 4
 - ? Exactly one character (no matter which one)
 - $\widetilde{}$ Shortcut for the user's home folder
 - . "this folder"
 - .. the "parent folder"

Overview

Datastreams Channels Redirection Pipes Common redirection tasks

э

Basics Datastreams 00000 ●0 000 000 00 00 00 00 00 00 00 00 00 00 00 00 000 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	EMBOSS 0 00	
Channels							
Channels							

Input and output channels are a common concept in Linux. Think about them as entrance and exit of programs. Most programs take in raw data on one side and spit out result data on the other.

Basics 00000 000 00 00 00000 00000	● 0 000 00 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	EMBOSS 0 00	
Channe	ls							

Input and output channels are a common concept in Linux. Think about them as entrance and exit of programs. Most programs take in raw data on one side and spit out result data on the other.

Usually the "entrance" of a program is connected to your keyboard and the "exit" to your terminal.

Channels

Basics 00000 000 00 00 00000 00000	00 000 00 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0		emboss o oo	
Channels									

std-Channels

- stdout The standard channel for output (1), per default connected to your terminal
- stderr The standard channel for error messages (2), per default also connected to the terminal
- stdin The standard input channel, per default connected to your keyboard

Basics 00000 00 00 00 00000 00000		Filtering 00 0000 00	CSV files 0000 0	Loops 0 0 0	emboss o oo	
Redirect	tion					

Redirecting output

You can redirect any program's output into a file, separately for normal output and error output:

```
ls -1 > folderlisting 2> listerrors
```

This will create a file called "folderlisting" and fill it with the output of the ls command. Any possible errors will end up in "listerrors".

"»" will redirect output and *append* it to a file, thus not overwriting it.

Basics 00000 00 00 00 00000 00000		Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops O O O	emboss o oo	
Redirect	tion							

Redirecting input

You can also redirect any file's content to the input channel of any program that is capable of accepting text input:

sort < some.txt</pre>

This will redirect the content of "some.txt" to the program "sort", which will –unsurprisingly– print it out in alphabetical order.

Basics 00000 00 00 00 00000 0000	00 00● 00 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	emboss o oo	
Redirec	tion							

Never try to simultaneously read from and write to a given file. You will end up with it being emptied!

Caveat

Basics 00000 000 00 00 00000 00000	00 000 •0 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0 0	emboss o oo	
Pipes								

The plumbing

In contrast to the redirection operators (>...), the "pipe" (|) is used to connect one program's output to another one's input channel.

```
1s -1 | sort -r
```

This e.g. will give you a directory listing in reverse order.

	00 000 0● 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops O O O	emboss o oo	
Pipes								

Using redirects and pipes you can construct complex sequences of commands reading from different files and producing output in others.

Part of the GNU/Linux philosophy is to have small efficient programs dedicated to one given task each and to solve complex tasks by plugging together the right tools.

Pipelines

	Datastreams	Filtering	Counting	CSV files	Editing	Loops	EMBOSS	
00000 000 00 00	00 000 00	00 0000 00			000

Filtering Filtering lines Regular expressions Common filtering tasks

▶ ∢ ≣ ▶

< 一型

Basics 00000 000 00 00 00000 00000	00 000 00 00	Filtering ●0 ○○○○ ○○	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops O O O	emboss o oo	
Filtering	g lines							

grep

grep is a versatile program designed to filter lines from textfiles.

Basic usage: "grep pattern file" will output every line from "file" with an occurrence of "pattern".

Patterns can be just keywords, parts of keywords or complex expressions.

Basics 00000 00 00 00 00 00000 00000	00 000 00 00	Filtering ○● ○○○○ ○○	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops 0 0	emboss o oo	
Filtering	g lines							

grep's Options

- -v Reverse search, everything that doesn't include...
- -c Don't show hits, just count.
- -B, -A Add *n* lines before or after the hit.
 - -f Read pattern(s) from file.
 - -i Case-insensitive search.
 - -o Show only matching parts of line.

Basics 00000 00 00 00 00000 00000		Filtering ●○ ●○○○	CSV files 0000 0	Loops 0 0 0	emboss o oo	
Regular	expressions					

What are regular expressions?

Regular expressions are rulesets that describe variable text patterns. They can be used to filter or automatically edit text files.

In the easiest case the "RegEx" could actually be just a keyword. In more complex cases it could match hundreds of different expressions.

Basics 00000 00 00 00 00000 00000		Filtering ●○ ●○○○	CSV files 0000 0	Loops 0 0 0	emboss o oo	
Regular	expressions					

What are regular expressions?

Regular expressions are rulesets that describe variable text patterns. They can be used to filter or automatically edit text files.

In the easiest case the "RegEx" could actually be just a keyword. In more complex cases it could match hundreds of different expressions.

The RegEx language is rather complicated and there are several dialects. But they have a couple of basic things in common.

	Datastreams	Filtering	Counting	CSV files	Editing	Loops	EMBOSS	
00000 000 00 00 00000 00000	00 000 00 00				000			

The RegEx language

/RegEx/ Slashes traditionally enclose RegExs. Can be a
 pair of other characters if more convenient.

Countir	ng tools						

Counting things

There are several tools to count things:

- grep With the "-c" option grep will only count occurences.
 - wc The general purpose counter. Options: -I for lines, -m for chars, -w for words...
- uniq With the option "-c" uniq will report how many identical occurences of each unique line there were.
 - nl Will add line numbers.

Working with CSV-like files Tabular data Common csv tasks

Basics 00000 00 00 00 00000 00000		Filtering 00 0000 00	Counting 00 0	CSV files ●000 ○	Editing 000 000	Loops 0 0 0	emboss o oo	
Tabular	data							

What are CSV-like files?

Basic structure

CSV means "comma separated values", so originally those where tables organized in rows and columns, rows separated by newline characters, columns by commas. Optionally text values could be enclosed in double quotes. Optionally the first line could be declared as column headers.

Variants

Different separators are common (";", "Tab"...), use of newline chars is OS-dependent.

Тос	ols							

The most important tool for CSV work is "cut". It can cut out columns from tabular data. Options:

- $-d \times$ Specify the delimiter that is assumed to separate columns.
- -f n Specify which columns to output. Can be a comma-separated list and/or n-m expressions.

"csvtool" can be a more failsafe alternative if it is available.

Commandline-based Editors

Working with sed

sed rules generally look like this:

sed -opt '/addr/c/RegExMatch/RegExReplace/m' filename

addr optional numeric or regular expression to define which lines to work on

c a one letter command like "d" (delete) or "s" (substitute)

RegEx rules what to look for and what to do to it

m an optional modifier like "g" (global) or "i" (case insens.)

Overview

Loops for. . . in; do. . . while...;do... Common tasks with loops

э

	Datastreams	Filtering	Counting	CSV files	Editing	Loops		EMBOSS	
00000 00 00 00 00000 00000	00 000 00 00	00 0000 00	00	0000	000	000	0	0 00	00

Loops

Loops are constructs that take care of repetitive tasks for you. They usually repeat something several times that is enclosed by the key words "do" and "done". In most cases there is a helper variable involved that stores each element of some list in turn. Such constructs are elements of every programming language.

Basics 00000 00 00 00 00000 00000		Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops O O	emboss o oo	
for in	; do							

for Loops

For loops repeat things for every element in a list.

for i in \$(seq 1 10); do echo \$i ; done

seq will generate a series of numbers. The commands between "do" and "done" will be run for every number. The numbers are temporarily stored in the variable "i".

Basics 00000 000 00 00 00000 00000	00 000 00 00	Filtering 00 0000 00	Counting 00 0	CSV files 0000 0	Editing 000 000	Loops ○ ● ○	emboss o oo	
while	. ;do							1

While loops repeat tasks as long as a certain condition is met.

while read a; do echo "\$a" ; done < somefile.txt

read will get every line from "somefile.txt" and put it into the variable "a". The while loop will be run as long as read can get new lines.

while Loop

Common tasks with loops

Tasks for loops

Make an alignment for every sample:

for s in \$(cat samples.txt); do mafft "\$s".fasta > "\$s".aln.fasta ; done

Make a tree for every group of sequences:

```
while read s; do mafft "$s".fasta > "$s".aln.fasta ;
sed -i /"^>"/s/"\(>.\{,10\}\)"/"\1"/ "$s".aln.fasta;
raxmlHPC8 -s "$s".aln.fasta -n "$s".tre -m GTRCAMMA ;done < samples.txt</pre>
```

Append a number to every FASTA description:

```
for i in $(seq 1 $(grep -c "^>" multi1.fasta )); do echo $i;
sed -i 0,/">.*[^0-9]$"/s/"\(^>.*[^0-9]\)$"/"\1$i"/ multi1.fasta; done
```

Awk									
awl	<								

Awk is a programming language by itself. It is especially well suited for text manipulation. For small tasks you can envoke it like this:

```
cat data.csv | awk -F "," '{print "#Spalte 1: "$1"#, #Spalte 2: "$2"#"}' |
tr "#" "'" > data2.csv
```

AWK tasks

Write XML from CSV.

cat data.csv | awk -F "," 'BEGIN {print "<xml>"}
{print "<dataset>\n\t<art>"\$1"</art>\n\t
<occurrences>"\$2"</occurrences>\n</dataset>\n"}
END{print "</ml>"}'

"European Molecular Biology Open Software Suite"

Emboss is a free collection of small tools to accomplish common bioinformatics tasks published by the EBI. You will find many web applications to allow browser access to it. You can also use it for automated work in your own pipelines, though. The programs are designed to ask you for missing parameters interactively. You can change this behaviour by setting the option "-filter" which will allow you to pipe data through them.

Embos	is tools						

Some EMBOSS tools

- seqret interconverts sequence formats (fasta to embl, genbank to nexus...)
- transeq translates into protein sequences
- revseq converts into the reverse (complemented) sequence
- degapseq removes gaps from an alignment
 - distmat creates a distance matrix from an alignment

Emboss	tools							

Emboss tasks

Reverse complement a set of sequences:

cat multi1.fa | revseq -filter > multi1.rev.fa

R								
R								

R is a kind of hybrid between a statistics software and a programming language. As such it is especially well suited to do statistics on large datasets.

It is extremely versatile because there is a very active community providing function libraries for virtually every aspect of data analysis from descriptive statistics to NextGen-Sequences.

You can work with R by starting it: "R".

This will bring you to R's own shell where you can start using R functions. To quit just type "q()".

R							
R							

R is a complex language with very special concepts of data handling and far beyond the scope of this little workshop. So just a few very basic examples...
